

ABSTRACT OF THE DISCLOSURE OF THE INVENTION

In a cotton candy making apparatus with a removable tray according to the present invention, a main power supply switch and an auxiliary switch are provided. The main power supply switch is locked by being rotated in a predetermined direction while being depressed. Contacts of the auxiliary switch are closed when the tray is properly attached to a main body of the apparatus. Thus, it is constructed such that power is not supplied to the apparatus by the main power supply switch unless the contacts of the auxiliary switch are closed. Carbon brushes are used for brush devices for supplying electric current to a heater for a rotary pot, and the carbon brushes are each biased in a slip ring direction with a spring in a brush holder. In addition, a cover for the rotary pot is provided which is constructed so as to be assembled to and disassembled from the rotary pot, without using machine screws or nuts, by rotating the same cover. Furthermore, a translucent tray is made from a material having translucency, and light emitting portions are provided on the main body of the apparatus for illuminating cotton candies which are being made within the tray.
